

Methodology

Social Engineering is one of the most important components of an effective Information Security Program. Our tools provide the client with a highly effective capability to measure the cyber behavior of the workforce. We often embed Social Engineering within our Awareness and Training and/or Security Management-as-a-Service offerings. Breaches often start with a Hacker gaining access through an email phishing exploit. Our Social Engineering tests give the client insight into the actions of each employee who is tested.

The Results

Our reports provide key data on aggregate and individual employee behavior, starting with pass/fail percentages. Individuals can be educated in real-time with greater positive impact.

We can also provide detailed data in spreadsheet format for ongoing tracking and trending of workforce cyber behavior.

CSB IT Security Experience

Why CSB IT Security?

Healthcare CIO executive experience

Certified technical experts

Risk Assessments that have passed CMS and OCR audits

Security experience with diverse healthcare organizations –
hospitals, large physicians groups, HIEs, managed care
organizations, IPAs and business associates

Modular approach designed to meet the practical needs of
healthcare organizations

Practical solutions to combat the increasing threat of Hackers
